

8.5. Circles & Circumferences

May 07, 2007

Circle P : $\odot P$

The set of all Points in the Same Plane having the same Distance from a common Pt. known as the Center.

Radius: (r): the distance from the center of the circle to Any Pt. on the circle

Diameter: (d): a chord that contains the center

Chord: Any segment whose endpoints are points on the circle.

The Relationship Between (d & r)

$$\underline{\underline{d = 2r}} \quad \text{same} \quad \underline{\underline{\frac{1}{2}d = r}}$$

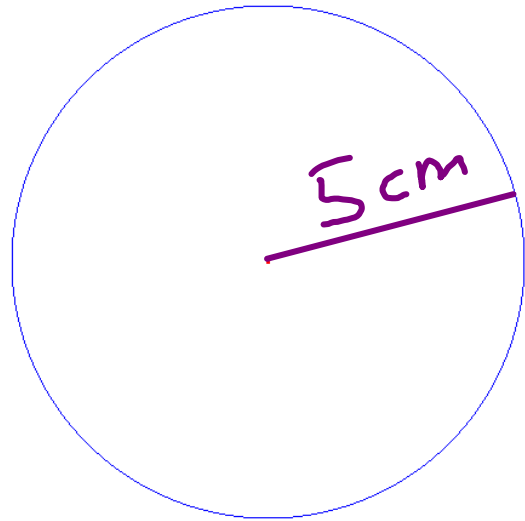

Circumference: the distance around a 

- Every Circle is divisible by π (pi)
diameter radius

$$C = \underline{d}\pi$$

$$C = \underline{2}\pi\underline{r}$$

for us $\underline{\underline{\pi = 3.14}}$

Order
#, π , units

find the Circumference

Here we have the Radius
So...

$$C = 2\pi r$$

$$= 2\pi (5\text{cm})$$

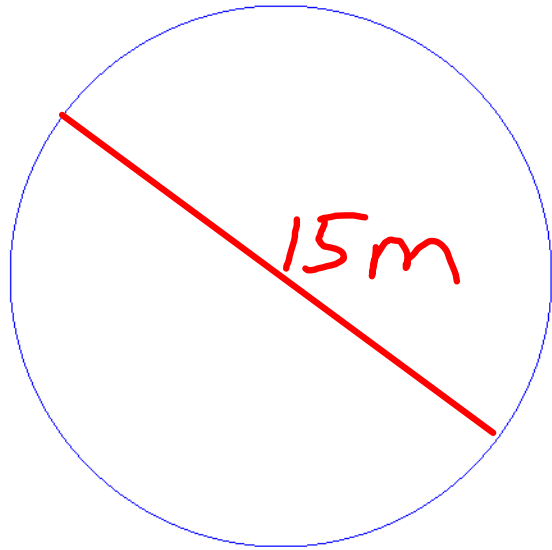

$$= 10\pi\text{cm}$$

exact

$$\approx 10(3.14)\text{cm}$$

$$\approx 31.4\text{cm}$$

approx

Find the Cir.
here we have the diameter

$$C = d\pi$$
$$= \underline{\underline{15\pi m}} \rightarrow \text{exact}$$

$$\approx 15(3.14)m$$
$$\approx 47.1m \rightarrow \underline{\underline{\text{approx.}}}$$

The C. is 125.6m
find the d & r of this \odot

$$C = d\pi$$

$$125.6m = d\pi$$

$$\frac{125.6m}{3.14} = \frac{d \cdot 3.14}{3.14}$$

$$\underline{\underline{40m = d}}$$

$$\frac{40m}{2} = \frac{2r}{2}$$

$$\underline{\underline{20m = r}}$$

$$\pi \approx 3.14$$

$$\frac{100 = d \cdot 5}{5 \quad 5}$$

$$d = 2r$$
