Parallel Lines: different Lines
in the Same Plane that
Never intersect.

Line A

$$\begin{array}{r} -x + 2y = 6 \\ +x \quad +x \\ \hline 2y = x + 6 \\ \frac{2y}{2} = \frac{x}{2} + \frac{6}{2} \\ y = \frac{1}{2}x + 3 \\ y = mx + b \end{array}$$

Line B

$$\begin{array}{r} -x + 2y = -2 \\ +x \quad +x \\ \hline 2y = -x - 2 \\ \frac{2y}{2} = \frac{-x}{2} - \frac{2}{2} \\ y = -\frac{1}{2}x - 1 \\ y = mx + b \end{array}$$

Line C

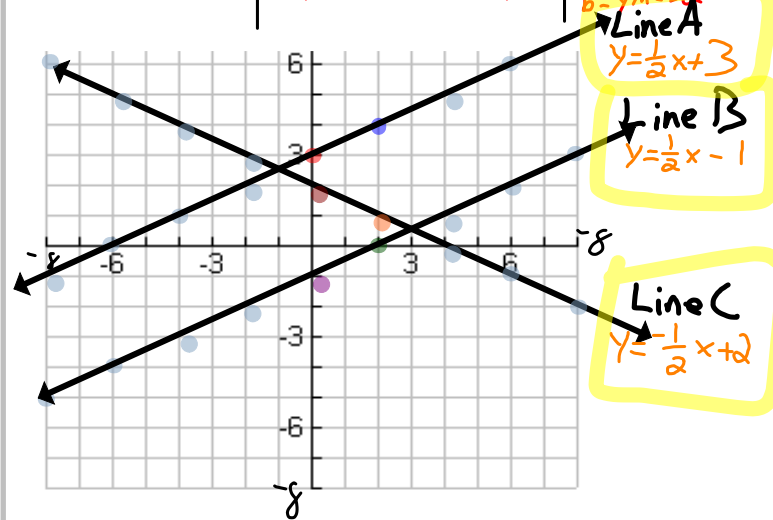

$$\begin{array}{r} x + 2y = 4 \\ -x \quad -x \\ \hline 2y = -x + 4 \\ \frac{2y}{2} = \frac{-x}{2} + \frac{4}{2} \\ y = -\frac{1}{2}x + 2 \\ y = mx + b \end{array}$$

$$m = \text{slope} = \frac{\text{rise}}{\text{run}} = \frac{\text{change in } y}{\text{change in } x} = \frac{y_2 - y_1}{x_2 - x_1}$$

$m = \text{slope} = \frac{\text{rise}}{\text{run}} = \frac{1}{2}$
 Up 1
Right 2
 $b = y\text{-int} = 3 \Rightarrow (0, 3)$

$m = \text{slope} = \frac{\text{rise}}{\text{run}} = \frac{1}{2}$
 Up 1
Right 2
 $b = y\text{-int} = -1 \Rightarrow (0, -1)$

$m = \text{slope} = \frac{\text{rise}}{\text{run}} = -\frac{1}{2}$
 Down 1
Right 2
 $b = y\text{-int} = 2 \Rightarrow (0, 2)$

Which are Parallel?

Lines A + Line B

Why? Because they
have the Same Slope of $\frac{1}{2}$ +
different y-int. + they
are on the Same Plane!

O.T.L.

① Pg 246: 1-10 (all)
11, 12, 14, 15, 35, 37, 39, 41
Same
Coord. Plane.

① Correct the above.

② 43-45 (all); 49-52 (all)
